

1.2 – Purpose of the Project

The main purpose of the Strategic Product Placement Analysis project is to analyze how product placement, pricing, promotions, and customer behavior influence sales performance in a retail environment. The project helps businesses identify the most effective locations for displaying products to maximize visibility, customer engagement, and revenue.

By examining factors such as product categories, foot traffic, consumer demographics, competitor pricing, and promotional activities, the analysis provides valuable insights into customer purchasing patterns. These insights enable retailers to make informed decisions regarding store layout, product positioning, and marketing strategies.

The project aims to:

- Identify the best product placement locations to increase sales.
- Analyze the relationship between foot traffic and sales volume.
- Evaluate the impact of product categories on sales performance.
- Understand customer preferences based on demographic data.
- Assess the effectiveness of promotional activities.
- Compare product prices with competitor prices to improve pricing strategies.
- Optimize store layouts for better customer experience.
- Support data-driven decision-making in retail management.
- Improve overall business profitability and operational efficiency.
- Enhance customer satisfaction by making products easier to find and purchase.

Overall, the project helps retailers use data analytics to improve product visibility, increase sales, and achieve better business outcomes.
